## Notes

*23 October 2014, Bill Allan, Obtainer, Planner and Operator*

- Received and reviewed the case information.
- Analyzed and uploaded the peak data to system2 World Boston.
- Following review of the data with Jenn Hornyak, proposed the initial requests:

name	n contribs	knowns	degraded	cycles
glove_ncon3_5K	3			5K
glove_ncon4_5K	4			5K
glove_ncon3_dgrd_200K	3		on	200K
glove_ncon4_dgrd_200K	4		on	200K

*28 October 2014, Bill Allan, Operator*

- Following discussion with Dr. Perlin, replicated initial requests and include new requests assuming reference as known contributor:

name	n contribs	knowns	degraded	cycles
glove_ncon3_dgrd_200K_rep1	3		on	200K
glove+TT_ncon3_dgrd_200K	3	TT	on	200K
glove+TT_ncon3_dgrd_200K_rep1	3	TT	on	200K
glove_ncon4_dgrd_200K_rep1	4		on	200K
glove+TT_ncon4_dgrd_200K	4	TT	on	200K
glove+TT_ncon4_dgrd_200K_rep1	4	TT	on	200K

### Preliminary report

- sent by email from Dr. Perlin to Jennifer Montgomery on 5 Nov 2014

*Jennifer,*

*Cybergenetics completed its initial TrueAllele® computer processing on the glove data in your 'case with relatives'. Here are conservative estimates from the preliminary results.*

*The TrueAllele computer found that a match between the glove interior (Item 12-9.5.1) and Brother #1 (Item 15-1.1, TT) is about ten thousand times more probable than coincidence.*

*The computer found that a match between the glove interior (Item 12-9.5.1) and Brother #2 (Item 12-1.1.1, DT) is about a thousand times more probable than coincidence.*

*Based on TrueAllele validation studies, and specificity measurements made on the evidence genotypes in this case, these results are well-separated from statistics for someone who did not contribute their DNA to the*

*mixture.*

*Please let me know whether you would like Cybergenetics to confirm these TrueAllele results and prepare a DNA match report. This reporting would take one to two weeks for us to complete.*

*Thanks. - Mark*

*5 November 2014, Bill Allan, Operator*

- Following discussion with Dr. Perlin, replicated requests and added 5 contributor requests:

name	n contribs	knowns	degraded	cycles
glove+TT_ncon4_dgrd_200K_rep2	4	TT	on	200K
glove_ncon5_dgrd_200K	5		on	200K
glove_ncon5_dgrd_200K_rep1	5		on	200K
glove_ncon5_dgrd_200K_rep2	5		on	200K
glove+TT_ncon5_dgrd_200K	5	TT	on	200K
glove+TT_ncon5_dgrd_200K_rep1	5	TT	on	200K
glove+TT_ncon5_dgrd_200K_rep2	5	TT	on	200K

## Report

- draft posted 5 December 2014 by Bill Allan  
 - final review on 8 December 2014 done by Dr. Mark Perlin  
 Boston\_report.doc

- Data. Peaks mainly between 50 and 1000 rf.
- Mixture. Consistent with at least 3 contributors (CSF, D21, FGA, TH01), possibly 4 (D3) or 5 (D18).
- Degradation. Some differential degradation between contributors.
- Separation. Better separation when using more contributors.
- Convergence. Good MW convergence, largely with GR < 1.2.

## Match to suspect DT

- Genotype inference. Different from the population genotypes, with average KL ~ 4.
- Genotype separation. Similar contributor genotypes, with some probability differences.
- Genotype concordance. Good agreement across 7 independent computer runs.
- Genotype match. Suspect-matching genotype mixture weight = 0.3066 (stdev = 0.1412) & KL = 6.1885.
- Reported match. Representative genotype match to suspect with log(LR) value 4.3824.

Boston 13-08140 evidence MASP glove\_ncon5\_dgrd\_200K\_rep1 14 2

glove\_ncon5\_dgrd\_200K\_rep1 contrib 2 vs. DT.xls

## Match to suspect TT

- Genotype inference. Different from population, with average KL ~ 5.
- Genotype separation. Similar contributor genotypes; some probability differences.
- Genotype concordance. Good agreement between 7 independent computer runs.
- Genotype match. Suspect-matching genotype mixture weight = 0.3039 (stdev = 0.1287) & KL = 6.2119.

- Reported match. Representative genotype match to suspect with log(LR) value 4.8488.

Boston 13-08140 evidence MASP glove\_ncon5\_dgrd\_200K\_rep2 19 3

glove\_ncon5\_dgrd\_200K\_rep2 contrib 3 vs. TT.xls

#### *Comparison with both suspects DT & TT*

- The two references share many alleles, which is consistent with siblings.
- At loci where they share no alleles (TH01), there is support for both genotypes in the data.
- At loci where they share one allele (CSF,D13,D16,D18,D19,D21,D3,D5,D8,TPOX), there is data support for both.
- At loci where the genotypes are the same (D2, D7, FGA, vWA), assuming TT reduces DT probability.
- Their LR's have similar numerical values.

Signed report sent by Dr. Perlin to AUSA Weinreb on 8 Dec 2014

## ***Data***

Quantitative peak data from STR experiments on biological evidence that was entered as input for TrueAllele<sup>®</sup> computation.

## **Table**

The data table shows the peak information for each evidence item. Each row gives statistics for one peak. The columns describe the peak as:

The DNA template that includes the peak.

The track indicates the amplification(s) included in the template.

The locus that includes the peak.

The peak's designation (i.e., number of repeats).

The base pair length of the peak.

The peak's height in RFU values.

The area under the peak.

## ***Request***

This section describes the TrueAllele<sup>®</sup> computer interpretation runs ("requests") that were reviewed on the DNA evidence data in this case, including request run parameters and computer processing times.

## **Listing**

The request table has columns for the name of the computer request, the number of contributors, how many known genotypes were assumed, options that were turned on or off (e.g., degraded), and the number of sampling cycles. The number of cycles is expressed in thousands (e.g., 100K means 100 thousand). The number of burn in cycles is the same as the number of sampling cycles.

Name	Contributors	Known	Degraded DNA	Cycles
glove_ncon3_dgrd_200K	3		on	200K
glove_ncon3_dgrd_200K_rep1	3		on	200K
glove+TT_ncon3_dgrd_200K	3	TT	on	200K

## **Genotype**

Genotype results are provided for the reported DNA match statistics. When there is uncertainty, allele pair probabilities are given.

<i>Evidence</i>	Computer-inferred contributor genotypes are provided at every locus.
<i>Reference</i>	The reference genotypes used in the case.
<i>Population</i>	The allele frequency data used for population genotypes

## **Evidence**

The genotypes used in the reported DNA match statistics are listed. The genotype tables show the inferred posterior genotype distribution at a confidence level of 99%. The table rows show the probability of one allele pair value (allele1 and allele2) of the inferred contributor genotype, organized by locus.

## Reference

The reference genotype table shows the allele pair values (allele1 and allele2) for each locus for the reference.

**Suspect 12-1.1.1, Dzhokhar Tsarnaev**

locus	allele 1	allele 2	probability
AMELO	1	2	1
CSF1PO	11	11	1

## Population

A population table describes the ethnic sample at each locus, listing for each allele designation the number of counts observed.

**United States FBI African American Population**

## Match

DNA match statistic (likelihood ratio) results are reported for genotype comparisons between evidence and reference relative to a population. Each match table appears twice, first with only positive match values (extent of inclusion), and then with all the match values (both inclusion and exclusion).

## Table

1. Each **row** of the spreadsheet provides summary results for a TrueAllele-inferred evidence genotype of a contributor to a biological evidence item.

2. The **columns** describe the contributor genotype as:

<i>Evidence</i>	A 'request name' is an identifier that names a TrueAllele interpretation request. The identifier usually contains a case name, followed by an evidence item name, and may describe parameter settings as well. More information about the test conditions is found in the Request section.
<i>Contributor</i>	This field identifies which contributor to the mixture is being described.
<i>N contrib</i>	The total number of contributors assumed to be present in a mixture.
<i>Weight</i>	The inferred mixture weight for the specified contributor.
<i>Std Dev</i>	The standard deviation of that contributor's mixture weight.
<i>KL</i>	The average log(LR) statistic indicates to what extent the inferred contributor genotype differs from a population genotype.
<i>References</i>	Each succeeding column specifies a particular reference genotype.

3. Each match **entry** gives the likelihood ratio (LR) DNA match statistic between a pair of evidence (row) and reference (column) genotypes. The LR is displayed as a log(LR) value that gives the logarithm (or, powers of ten) of the LR.

The log(LR) value shown is the smallest one across the considered reference populations. The LR values are computed assuming a coancestry coefficient of 1%.

The LR is a nonprejudicial numerical assessment of the probative force of the specified DNA evidence for the hypothesis that a particular individual contributed their DNA to the biological evidence. The statistic can be read as saying "a match between the suspect and the evidence is (the LR value) times more probable than coincidence."

**Item 12-9.5.1**

## Locus Table

A locus table is provided for each reported match. The table gives the log(LR) values of individual loci. A row corresponds to the locus indicated in the first column. Each subsequent column gives locus statistics for a different ethnic population.

<i>Total</i>	The sum of the log(LR) values.
<i>Joint</i>	The total likelihood ratio as a linear number.
<i>Words</i>	The total likelihood ratio as a descriptive phrase.

**Item 12-9.5.1 v. suspect 12-1.1.1**

## Specificity

The specificity chart and tables show how a reported match between evidence and a subject genotype relates to matches between the evidence and random genotypes.

### Chart

<i>graph</i>	The histogram displays the match statistic $\log(\text{LR})$ distribution between the inferred genotype and random non-contributor genotypes for a given reference population
<i>x axis</i>	$\log(\text{LR})$ values
<i>y axis</i>	Number of times each $\log(\text{LR})$ value appears when comparing the inferred genotype to the non-contributor genotypes (e.g. counts)
<i>arrow</i>	Reported match $\log(\text{LR})$ value

### Statistics table

<i>N</i>	Number of match statistics calculated for the distribution
<i>minimum</i>	Smallest match statistic between the inferred genotype and the random non-contributor genotypes
<i>mean</i>	Average match statistic
<i>median</i>	Middle match statistic
<i>maximum</i>	Largest match statistic
<i>std dev</i>	Standard deviation of the distribution
<i>positive</i>	Number of $\log(\text{LR})$ values greater than zero
<i>mu</i>	Mean of the normal curve modeled to the distribution
<i>sigma</i>	Standard deviation of a normal curve modeled to the distribution

### Item table

<i>item</i>	Name or number of the genotype; typically a case reference
<i>LR</i>	Likelihood ratio value between the inferred genotype and the item, relative to a reference population
<i><math>\log(\text{LR})</math></i>	<u>Logarithm</u> of the LR (e.g. “number of zeroes”)
<i>z-score</i>	Number of standard deviations the item $\log(\text{LR})$ value is from the mean
<i>p-value</i>	Probability of a non-contributor having a match statistic equal to or greater than the item $\log(\text{LR})$

**Item 12-9.5.1 and suspect 12-1.1.1**

Comparison was made between the reported evidence genotype and 10,000 randomly generated genotypes from the United States FBI Caucasian population to calculate the LR match statistics.

stat	value	item	LR	log(LR)	z-score	p-value
N =	10000	12-1.1.1	45.2 thousand	4.65	4.2338	$1.15 \times 10^{-5}$
minimum	-20.3192					
mean	-7.8789					
median	-7.8219					
maximum	3.0113					
std dev	2.9606					
positive	29					
mu	-7.8789					
sigma	2.9604					

**Item 12-9.5.1 and suspect 15-1.1**

Comparison was made between the reported evidence genotype and 10,000 randomly generated genotypes from the United States FBI Caucasian population to calculate the LR match statistics.

stat	value	item	LR	log(LR)	z-score	p-value
N =	10000	15-1.1	155 thousand	5.19	4.4473	$4.35 \times 10^{-6}$
minimum	-21.1854					
mean	-8.1581					
median	-8.1022					
maximum	2.5734					
std dev	3.0017					
positive	27					
mu	-8.1581					
sigma	3.0015
